

## Case Study

### A Leading Chemical Company

**Our client invoices for their goods as a number of different trading companies and were looking for a way to improve the processing of their invoicing.**

#### **The Business Issue**

Each trading company had a specific pre-printed stationery to be used for the invoices with associated management and cost implications. The pre-printed stationery had a logo on the facing page and terms and conditions on the reverse. Weekly a run of invoices was made which generated a formatted ASCII data file ready to be printed on the pre-printed stationery.

#### **The Solution**

After consultation DTP implemented a solution based around their proprietary Jupiter™ platform which did away with the pre-printed stationary relying instead on digital templates. Using the Jupiter™ API a turnkey system was made possible where each day deliveries of invoicing data in the original ASCII format are made to the Jupiter servers. Each delivery is tagged as belonging to a specific delivery and once at the servers, the invoicing data is broken down and merged on the server with the specified template before transmitting a print ready file to the chosen document service provider. In addition, the terms and conditions that previously appeared on the reverse of every page are now merged onto the back of page one of each invoice only. This makes for a saving of almost 50% in paper prices along with the removal of the overhead of pre-printed stationery management.
